M4 timelapse

HoloMonitor™

HoloMonitor M4

The HoloMonitor M4 is a timelapse instrument and cell analyzer that utilizes a powerful analysis software.

It is based on digital holography, which offers non-invasive live cell imaging directly in the cell's usual growth environment without staining.

What can the M4 do?

The HoloMonitor M4 captures holographic images of unstained, adherent cells without affecting them. As the M4 is incubator safe, it is an excellent timelapse instrument. Additionally, with the HoloStudio software, cell imaging and cell counting as well as cell area and volume studies are easily performed.

Key benefits:

- works on adherent cells
- no phototoxicity
- no staining or labeling
- cell area and volume analysis
- long term time-lapse
- will constrain cell tracking
- incubator safe
- cell count and confluence
- 3D imaging
- easy to handle
